Keeping your energy bills under control

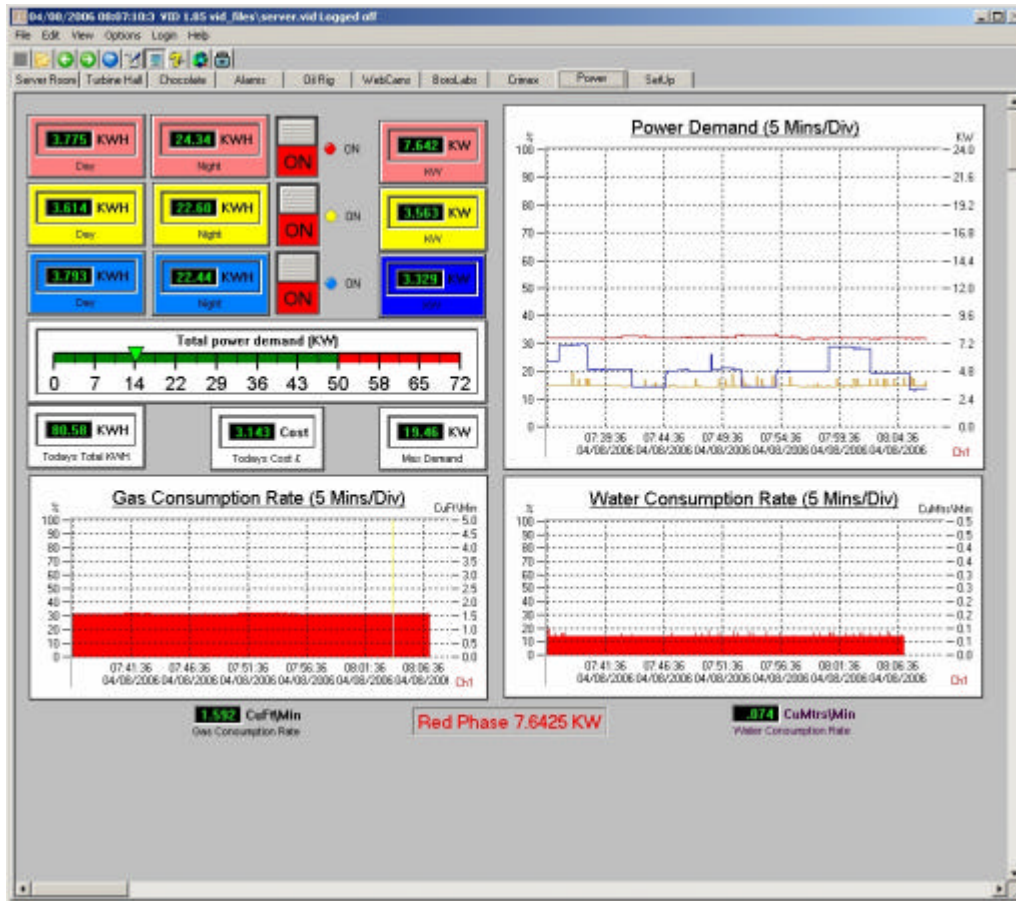

# NetCommander's Energy Usage Monitoring

Are increasing business energy costs eating into your profit?

Not sure how to identify wasteful energy usage and processes during the week and over the weekend?

Are you on the correct energy tariffs?

Start monitoring your business's energy consumption with NetCommander energy monitoring and start saving money and energy.

On average businesses waste a third of the energy that they buy and most of that could be saved with some simple, easy pay-back methods. The combination of NetCommander and our latest energy monitoring PC application will allow you to start monitoring your electricity, gas, oil, and water consumption.

Once you've identified wasteful processes you can take action to reduce your total energy demand. The NetCommander energy monitoring application provides an up to the minute indication of your business energy usage.

By monitoring your electricity supply you can see not only your current demand, but also the total demand and what it will cost you. In addition, the total and peak usage figures allow you to select the correct business supply tariff, or even take advantage of cheaper rates at off peak times.

Ever thought how much CO<sub>2</sub> your business is producing?

This application accurately calculates your CO<sub>2</sub> emissions based on your electricity and gas usage.
